On the cover: Irbesartan (IRB) and angiotensin (Ang) 1-7 suppresses oxidant stress, signaling and remodeling induced by Ang II in Ang-converting enzyme 2 (ACE2)-null cardiomyocytes and cardiofibroblasts isolated from pressure-overloaded hearts. In cardiofibroblasts, Ang II exposure stimulated mRNA expression of α-SMA with increased phosphorylation of ERK1/2 resulting in increased immunostaining for α-SMA which was prevented by pretreatment with IRB and Ang 1-7. n=4 from each group. ERK1/2 indicates extracellular signal-regulated kinase 1/2; α-SMA, α-smooth muscle actin. (See page 1195.)
