We don’t care if you paint your hair blue, rip the sleeves off your shirt or pierce your ear.

But don’t smoke just to be like your friends. Or to be different from your friends. Or to be anything at all. Because the simple truth of the matter is that with everything we know about cigarettes today, there’s only one thing you’ll be if you start smoking now. And that’s sorry.

Sorry you can’t get up in the morning without coughing your lungs out. Sorry you can’t climb a single flight of stairs without getting winded. Sorry that every time you light one up, your risk of heart and lung disease goes up.

And most of all, sorry that the casual habit you began as a teenager has turned into one you could die trying to break.

If you’re already a smoker—or if you’re considering becoming one—take some time to stop and think it all the way through. Right now, it’s your decision. In the long run, it’s your life.
Feb 19–23  Advanced Coronary Angioplasty Principles and Techniques. Stouffer’s Waikiki Beach Resort, Maui, HI David O Williams, director. Sponsored by Brown University Program in Medicine and Rhode Island Hospital, Providence. Inquiries Course Coordinator, Division of Cardiology, Rhode Island Hospital, Providence, RI 02903

Initial therapy should start hypertensive patients off right

Brief Summary
MINIPRESS* (prazosin hydrochloride) Capsules
For Oral Use
INDICATIONS:MINIPRESS* (prazosin hydrochloride) is indicated in the treatment of hypertension. As an antihypertensive drug, it is mild to moderate in activity and can be used as the initial agent in therapy or may be employed in a general treatment program in conjunction with a diuretic and/or other antihypertensive drugs used for other paraneoplastic effects. Warnings:MINIPRESS* may cause syncope with sudden loss of consciousness. In some instances this is believed to be due to an accessory induced hypotensive effect, although occasionally the syncopal episode has been preceded by a disturbance of the normal sleep patterns. A disturbance of the normal sleep pattern is not an adverse effect and should not be used as a reason to discontinue therapy. Treatment:Changes in blood pressure or heart rate are not necessarily indicative of the effectiveness of therapy. The dose of MINIPRESS should be increased slowly at intervals of 2 to 3 days until a satisfactory blood pressure is achieved.uria and changes in sperm testes and vasa efferent ducts have occurred at 25 mg/kg/day and retitration then earned out should they develop. The patient should also be cautioned to avoid situations which may cause syncope, occur during placebo or tolterodine therapy. The patient should also be instructed to avoid situations which may cause syncope, which may be avoided by keeping the patient in the supine position. The initial dosage of MINIPRESS should be adjusted as needed for patients response. patients should be started on the 1 mg capsule of MINIPRESS. The 2 and 3 mg capsules are not indicated for initial therapy. More common side effects of MINIPRESS are those symptoms often associated with lowering of the blood pressure: namely dizziness and light-headedness. The patient should be instructed about these effects and advised what measures to take should they develop. The patient should also be cautioned to avoid situations which may cause syncope, which may be avoided by keeping the patient in the supine position. The initial dosage of MINIPRESS should be adjusted as needed for patients response. The patient should also be instructed about these effects and advised what measures to take should they develop. The patient should also be cautioned to avoid situations which may cause syncope, which may be avoided by keeping the patient in the supine position. The initial dosage of MINIPRESS should be adjusted as needed for patients response. The patient should also be instructed about these effects and advised what measures to take should they develop. The patient should also be cautioned to avoid situations which may cause syncope, which may be avoided by keeping the patient in the supine position. The initial dosage of MINIPRESS should be adjusted as needed for patients response. The patient should also be instructed about these effects and advised what measures to take should they develop.
Initial therapy should start hypertensive patients off right

Minipress® for initial therapy
(prazosin HCl)
- Is effective when used alone
- Does not cause a significant incidence of sexual impotence, although it has been reported
- Does not adversely affect blood lipids
- Does not lower heart rate, cardiac output or work capacity
- Does not induce potassium wasting
- The most common side effects with Minipress, generally mild and transient, are: dizziness, headache, drowsiness, palpitations, nausea. Syncope (sudden loss of consciousness) has been reported in about 0.15% of patients at the recommended initial dose of 1 mg.

*Minipress is not indicated for the treatment of hyperlipidemia.
